Chemistry 12 Qualitative Analysis

Qualitative analysis is the process by which components of a mixture are separated and identified. Unlike quantitative analysis, where the amount of a particular material is measured, a qualitative analysis scheme simply confirms the presence or absence of certain materials. A scheme must be developed to separate the ions from each other. In this lab, we develop a **qualitative analysis scheme** to separate and identify the components of a chemical mixture. The mixture may contain all or some of iron (III) ion (Fe^{3+}), the barium ion (Ba^{2+}), and the silver ion (Ag^+). We will confirm or deny the presence of an ion through precipitation. A **precipitate** (solid) of the aforementioned cations may form in the presence of a specific anion, while the remaining metal ions remain **dissolved** (in aqueous form). The precipitate may then be separated by gravity filtration, see below. The solid precipitate is then left to dry on the filter paper.

Gravity filtration

This method of filtration is used to remove an insoluble solid material from a solution. A filter paper is folded (see below) and placed in a filter funnel which is then placed in the neck of an Erlenmeyer flask or supported in a clamp or ring stand. The solution to be filtered is then slowly and carefully poured into the funnel taking care not to fill the funnel above the edge of the filter paper. Once the solution has been poured, let it rest for a few moments to ensure that all the solution passes through. Remove the filter paper and allow the precipitate to dry.

OBJECTIVES:

1. To confirm or deny the presence of Fe^{3+} , Ba^{2+} , and Ag^+ cations in a solution using qualitative analysis.
2. To write out a detailed procedure for the precipitation and separation process
3. To write out the **net precipitate reaction** for each substance added to precipitate out the desired cation (assuming that it is present)

Procedure:

You will be given 25.0 mL of a solution that is believed to contain Fe^{3+} , Ba^{2+} , and/or Ag^+ cations. You are to design a step by step procedure for the separation of these ions (should they all be present). Write the procedure in the form of a flow chart. You will be provided with stock solutions of 1.0M NaCl, 1.0 M NaBr, 1.0 M NaI, 1.0 M Na_2SO_4 , 1.0 M Na_2S , 1.0 M NaOH, 1.0 M Na_3PO_4 , 1.0 M Na_2CO_3 and 1.0 M Na_2SO_3 for this task.
